

Table 17. 2014 Race 4 Fusarium wilt infested field evaluation of RBTN entries in western Kern¹ county near Buttonwillow, CA., conducted by Univ. of California and USDA/ARS (Hutmacher et al). This site is a naturally infested field site where presence of the race 4 Fusarium pathogen has been confirmed in prior pathology studies. Averages and standard deviations (σ) are shown.

Cultivar	Number of Plants Evaluated	Foliar		Vascular Root Staining [‡]		Number of Main Stem Nodes		Plant Height		Plant Percent Survival [§]	σ

Daytona RF and Phylogen 725RF - Moderately-Susceptible to Fusarium Race-4 (Acala Checks)

“Phy-802RF & Phy-811RF - Resistant to Fusarium Race-4 (Pima Checks)

¹Wester Kern County Fusarium wilt (FOV) race 4 field evaluation planted in May and evaluated during July (approximately 7-8 weeks post emergence)

[†]Foliar disease severity index scale: 0 = no symptoms; 1 = epinasty and slight dwarfing; 2 = 1 to 30% of leaves chlorotic; 3 = 31 to 80% of leaves chlorotic and severe stunting; 4 = 81 to 100% of leaves chlorotic; and 5 = plant death.

[‡]Vascular Root Staining: 0 = no vascular root staining evident, 1 = light vascular root staining evident as spotty areas, 2 = more continuous than 1, but light colored staining covering an area between one quarter and one half of the stem cross-section, 3 = moderate brown/black staining evident in a band encircling most of the stem cross section, 4 = brown/black staining evident across most vascular tissue in stem cross section, and 5 = plant severely damaged or plant death with staining evident throughout a cross-section of root tissue (Ulloa et al. 2006, 2009a).

[§]The percentage of plant survival (PS) was calculated by dividing the total number of surviving plants on sample date by the initial plant count after plant establishment, and multiplying by 100.
