¹Extremely dry conditions resulted in limited development of Verticillium wilt symptoms

[†] Percentage wilted plants = total wilted plants / 22 ft plot length.

[‡] Rated for defoliation on September 22 on a scale of: 0 (no defoliation), 1 = 1 leaf to < 33% defoliation, 2 = 33 - 66% defoliation, and 3 = > 66% defoliation.

Ratings recorded for plants in the area of each pace while walking the length of the plot. All ratings within a plot were averaged to produce a single rating per plot.
